The behavioral analysis of child development originates from John B. Watson's behaviorism. Watson studied child development, looking specifically at development through conditioning (see Little Albert experiment). He helped bring a natural science perspective to child psychology by introducing objective research methods based on observable and measurable behavior.

Behavior analysis of child development - Wikipedia

Intervention studies involving the use of sensory integration therapy (SIT) were systematically identified and analyzed. Twenty-five studies were described in terms of: (a) participant characteristics, (b) assessments used to identify sensory deficits or behavioral functions, (c) dependent variables, (d) intervention procedures, (e) intervention outcomes, and (f) certainty of evidence.

Autism therapies are interventions that attempt to lessen the deficits and problem behaviours associated with autism spectrum disorder (ASD) in order to increase the quality of life and functional independence of individuals with autism. Treatment is typically catered to the person's needs. Treatments fall into two major categories: educational interventions and medical management.

Autism therapies - Wikipedia

Integrating Behavioral Health with Primary Medical Care. Integrated behavioral health results when a team of providers, including physicians, nurse practitioners, behavioral health clinicians, community health workers, home visitors, and other health care providers, work together to address patient needs to achieve quality outcomes for every individual in care.
