Image Reconstruction 1 Planar reconstruction from projections

An image phantom called Shepp-Logan and its reconstructed image by inverse radon transform. There exist a lot of method to reconstruct image from projections which are divided to analytical methods include linear back projection (LBP), filter back projection (FBP), etc. and iterative methods e.g. algebraic reconstruction technique.

Image Reconstruction from Projection Reconstruct an image from a series of projections X-ray computed tomography (CT) "Computed tomography is a medical imaging method employing tomography where digital geometry processing is used to generate a three-dimensional image of the internals of an object from a large

Image Reconstruction from Projection

Before image reconstruction, a single-distance phase retrieval algorithm was applied to the projection images [19] using the STP software and setting the δ/β ratio to 15 (see [15,16] for details ...

Image reconstruction from projections suffers from an inherent difficulty: there are different images that have identical projections in any finite number of directions. However, by identifying the type of image that is likely to occur in an application area, one can design algorithms that may be ...

On Image Reconstruction from a Small Number of Projections

Iterative reconstruction: the reconstructed image is a solution of a maximization of an objective function. Starting from an initial guess, the image is updated iteratively so that it matches better the measured projections. Maximum likelihood expectation maximization (MLEM) searches for an image that makes the measured data most likely to ...

Reconstruction from projections - TUT

Image reconstruction techniques are used to create 2-D and 3-D images from sets of 1-D projections. These reconstruction techniques form the basis for common imaging modalities such as CT, MRI, and PET, and they are useful in medicine, biology, earth science, archaeology, materials science, and nondestructive testing.
