Transformative reagents for selective metalation, deprotonation and nucleophilic additions have allowed for unprecedented selective conversions to reactive intermediates within a molecule which contains sensitive functionalities under mild reactions.

However, with steric hindered Grignard reagents, the reaction may proceed by single-electron transfer.. Grignard reactions will not work if water is present; water causes the reagent to rapidly decompose. So, most Grignard reactions occur in solvents such as anhydrous diethyl ether or tetrahydrofuran (THF), because the oxygen in these solvents stabilizes the magnesium reagent.

Alkylation is the transfer of an alkyl group from one molecule to another. The alkyl group may be transferred as an alkyl carbocation, a free radical, a carbanion or a carbene (or their equivalents). An alkyl group is a piece of a molecule with the general formula $C_n H_{2n+1}$, where n is the integer depicting the number of carbons linked together. For example, a methyl group (n = 1, CH_3) is a ...

Organometallic chemistry is the study of organometallic compounds, chemical compounds containing at least one chemical bond between a carbon atom of an organic molecule and a metal, including alkaline, alkaline earth, and transition metals, and sometimes broadened to include metalloids like boron, silicon, and tin, as well. Aside from bonds to organyl fragments or molecules, bonds to ...

Joaquín Isac-García, ... Henar Martínez-García, in Experimental Organic Chemistry, 2016. 13.10.2 Background. Acetals are common carbonyl compound derivatives that are often used in Organic Synthesis as protecting groups for aldehydes and ketones, as well as in many other reactions. Cyclic acetals are formed by the acid-catalyzed reaction of an aldehyde or ketone with a diol —e.g. ...

Organosulfur compound: Organosulfur compound, a subclass of organic substances that contain sulfur and that are known for their varied occurrence and unusual properties. Organosulfur compounds occur in the bodies of all living creatures in the form of certain essential amino acids, enzymes, coenzymes, vitamins, and hormones.

Inside a battery, the electrodes (mainly the cathode) are the limiting factors in terms of overall capacity, i.e. energy density, and cyclability. There has been impressive progress in the exploration of electrode materials for lithium-based batteries such as various metal oxides and polyanionic compounds as well as anode materials as shown in Fig. 2, , .
